1	ABSTRACT
2	A folding bolster is used to treat circulation problems to prevent pooling of fluids in
3	patients. The bolster has three members connected together end-to-end. A first member has
4	a free end and a hinged end connected to a center member which has a hinged end and
5	flexible joints connecting the base member which includes a ratchet device. The members
6	are folded together to form an adjustable triangular frame with the free end of the first
7	member engaging the ratchet device. A patient is supported by the center member to
8	improve circulation.
